

1. Suppose there was a transaction that had been done in Bukalapak.com , the transaction id should be available on the screen alongside with the address of shipment, date of order, seller's name, and delivery service (JNE/POS/REX/others). The transaction id (TRX_ID) should also be available on the database which again supposedly there was a simple table containing all the transaction data.

Transaction Successful!

Transaction ID: 01023A9AC

Seller: FURHAN

Delivery Service: TIKI

Date order: 21/08/2016

Address Shipment: KAMPUNG DATOK KERAMAT

[Main menu](#)

TRX_ID	ADDRESS_SHIP	DATE_ORDER	SELLER_NAME	DELIVERY_SERVICE
01023A9AA	KAMPUNG DATOK KERAMAT	21/08/2016	FURHAN	JNE
01023A9AC	JALAN GURNEY	21/08/2016	FURHAN	REX
01023A9AD	UTM KUALA LUMPUR	21/08/2016	FURHAN	POS
.....
.....

Apparently, the order 01023A9AC seems to have different Delivery Service on the UI and the database record. How do you, as automation test developers develop such test scenario so that this kind of error does not occur?
